1. Determine which type of function would be most appropriate to fit the given data.

- a. exponential
- b. linear
- c. quadratic
- d. no relationship
- e. trigonometric

2. Which function below would be most appropriate model for the given data?

3. Hooke's Law states that the force F required to compress or stretch a spring (within its elastic limits) is proportional to the distance d that the spring is compressed or stretched from its original length. That is, F = kd where k is a measure of the stiffness of the spring and is called the spring constant. The table shows the elongation d in centimeters of a spring when a force of F newtons is applied. Use the regression capabilities of a graphing utility to find a linear model for the data. Round the numerical values in your answer to three decimal places.

- c. d = 0.112F
- d. d = 0.095F
- e. d = 0.905F

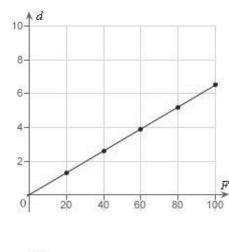

4. Hooke's Law states that the force *F* required to compress or stretch a spring (within its elastic limits) is proportional to the distance *d* that the spring is compressed or stretched from its original length. That is, F = kd where *k* is a measure of the stiffness of the spring and is called the spring constant. The table shows the elongation *d* in centimeters of a spring when a force of *F* newtons is applied. Use a graphing utility to plot the data and graph the linear model.
