94. Rancor Inc. had a per-unit conversion cost of \$2.50 during April and incurred direct materials cost of \$100,000, direct labor costs of \$75,000, and overhead costs of \$45,000 during the month. How many units did they manufacture during the month?
- 70,000
 - 18,000
 - 48,000

95. Lakeland Inc. manufactured 5,000 units during the month of March. They incurred direct materials cost of \$100,000 and overhead cost of \$40,000. If their per-unit prime cost was \$26.00 per unit how much direct labor cost did they incur during March?
- \$20,000
 - \$35,000
 - \$90,000
 - \$30,000

ANSWER: d

RATIONALE: SUPPORTING CALCULATIONS:
 $5,000 \times \$26 = \$130,000$ in total prime cost
 Prime cost less direct materials (\$100,000) = \$30,000
 Prime cost consists of direct materials and direct labor, therefore if total prime cost is \$130,000 and total direct materials cost is \$100,000, then direct labor would be \$30,000.

159. The Butchart Company manufactures microwave ovens. Last year, the per-unit product cost was \$56, the per-unit prime cost was \$34, and the per-unit conversion cost was \$42. Cost of goods sold for the year was \$560,000 and the sale price per unit was \$100. In addition, direct labor costs of \$200,000 and selling and administrative expenses of \$240,000 were incurred.

Required:

- A. Calculate how many units were sold last year
- B. Compute the cost of direct materials used
- C. Compute the cost of overhead
- D. Compute the gross margin for the year
- E. Calculate operating income

ANSWER:

A. Cost of goods sold $\$560,000 / \$56 = 10,000$ units

B. $10,000 \times \$34 - (\$200,000 \text{ of direct labor cost}) = \$140,000$

C. $10,000 \times \$42 - (\$200,000 \text{ of direct labor cost}) = \$220,000$

D.	Sales revenue (10,000 × \$100)	\$1,000,000
	Cost of goods sold	<u>560,000</u>
	Gross margin	\$ 440,000

E.	Gross margin	\$ 440,000

160. Picture It Inc. manufactures customized wooden frames. The direct materials needed to construct the frames are wood, glass and cardboard. Picture It has 22 employees who work a 40-hour work week and are each paid \$17 per hour. The company produced and sold 900 frames in the month of September.

During the month of September the following purchases were made to produce the 900 frames:

Wood—4000 ft. at \$1.20/ft.

Glass—400 pieces at \$5.60/piece

Cardboard—500 pieces at \$0.50/piece

Required:

1. Calculate the total product cost for the month. Assume that all employees worked four full weeks in September and that the company incurred \$55,000 in overhead costs.
2. Calculate the per-unit cost.
3. Calculate the gross margin for the month of September assuming that the company sells each frame for \$250.

ANSWER:

1. Direct materials:

Wood =	\$4,800	(4,000 × \$1.20)
Glass =	2,240	(400 × \$5.60)
Cardboard =	<u>250</u>	(500 × \$0.50)
	\$7,290	

Direct labor: \$ 59,840 (22 × 160 × \$17)

Overhead 55,000

Total cost \$122,130

2. $\$122,130 / 900 = \135.70

3. Gross margin = sales revenue – cost of goods sold

Gross margin = $\$225,000 (\$250 \times 900) - \$122,130 = \$102,870$

177. What is the difference between a period cost and a product cost?

ANSWER: A period cost is a cost that is not a product cost. It is expensed during the current period rather than inventoried. Examples of period costs are selling and administrative costs. A product cost is a manufacturing cost that is inventoried and expensed as Cost of Goods Sold only when the goods have been sold. Product costs are classified as direct materials, direct labor, or overhead.

178. List and describe the three categories of manufacturing costs.

ANSWER: Direct materials consist of the cost of materials requisitioned and used in production during the current period. Direct materials are materials that can be accurately and conveniently traced to the product. Direct labor consists of labor costs of workers directly involved in the manufacture of the product. Overhead consists of all the manufacturing costs that do not fall into the direct material or direct labor category. Examples of overhead costs include; insurance on the factory, machinery depreciation, indirect labor, indirect materials, factory supplies, etc.

179. Explain the difference between a cost that is included in valuing inventory and a cost that is not included in valuing inventory.

ANSWER: A cost that is included in valuing inventory is a cost of manufacturing the product. These costs are also referred to as product costs and manufacturing costs. They include direct materials, direct labor, and overhead. These costs are not expensed until the goods are sold. A cost that is not included in valuing inventory is a selling or administrative cost that is expensed immediately in the accounting period that it is incurred. These costs are also referred to as period costs or non-manufacturing costs.

180. Describe the purpose of the three inventory accounts used by a manufacturer.

ANSWER: The materials inventory is used to keep track of materials that have not yet been used in production. The work in process inventory is used to account for the costs of goods that were partially completed at the end of the accounting period and is used to accumulate current production costs. The finished goods inventory is used to account for the cost of goods that were finished at the end of the current period but have not yet been sold.

181. What is the difference between total manufacturing costs and cost of goods manufactured?

ANSWER: Total manufacturing costs are costs that are added during the period and consist of the cost of materials used, the direct labor costs incurred and the overhead costs incurred during the current period. Cost of goods manufactured would be computed by adding the beginning balance of work in process to and subtracting the ending balance of work in process from the total manufacturing costs.

You Decide

182. You are the accounting manager at Falcon Inc. You just hired a new staff accountant to assist you in breaking out costs into their appropriate classifications. The staff accountant asks you why cost classification is important.

How would you respond?

ANSWER: Cost classification is important for a variety of reasons. Probably the two most important are decision making and proper presentation on the financial statements. For example, by determining if a cost is fixed or variable it can help a company determine if each cost has a direct relationship to the level of output. If the company feels that their costs are becoming too high, then this type of classification can give them important information. Maybe the cost of the direct materials has increased significantly and they may need to look for a new supplier. Or when reviewing their fixed costs, they determine that the rent for their factory is causing the rise in costs and they should consider moving locations. The break out of product cost and period cost is also vital to a company. A company wants to know how much they are spending to actually produce the product (direct materials, direct labor, overhead) so that they can make such decisions as to the appropriate price to charge a customer. The allocation of product and period costs is also essential to properly generate the income statement, which is also used by external users to make decisions.
