| W = mg : 180 | 1b = m (32.2 ft/sec²)
| M = mg : 180 | 1b = m (32.2 ft/sec²)
| m = 5.59 slugs
| 180 | 1b
$$\left(\frac{4.4482 \text{ N}}{1b}\right) = \frac{801 \text{ N}}{1b}$$

| W = mg : 801 N = m (9.81 m/s²)
| m = 81.6 kg

1/3 The weight of an average apple is $W = \frac{5 \text{ lb}}{12 \text{ apples}} = 0.417 \text{ lb}$ Mass in slugs is $m = \frac{W}{g} = \frac{0.417}{32.2} = 0.01294 \text{ slugs}$ Mass in kg is $m = 0.01294 \text{ slugs} \left(\frac{14.594 \text{ kg}}{4 \text{ slug}}\right)$ = 0.1888 kg

Weight in N is W = mg = 0.1888(9.81) = 1.853 NThese apples weigh closer to 2 N each than to the rule of 1 N each!

$$F = \frac{Gm_{c}m_{t}}{d^{2}} = \frac{G(P_{c} + \frac{4}{3}\pi r^{3})(P_{t} + \frac{4}{3}\pi r^{3})}{d^{2}}$$

$$= \frac{GP_{c}P_{t}(\frac{4}{3}\pi r^{3})^{2}}{d^{2}}$$
With $G = 6.673(10^{-11})\frac{m^{3}}{kg \cdot s^{2}}$

$$P_{c} = 8910 \frac{kg}{m^{3}}$$

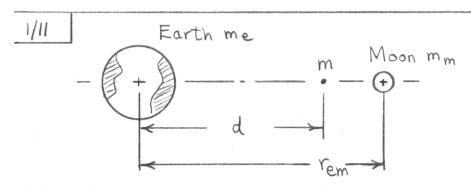

$$P_{t} = 3080 \frac{kg}{m^{3}}$$

we obtain, as vectors:

(a)
$$F = -1.255 (10^{-10}) i N$$
 (for $d = 2m$)
(b) $F = -3.14 (10^{-11}) i N$ (for $d = 4m$)

(b)
$$F = -3.14(10^{-11}) i N$$
 (for $d = 4m$)

$$\frac{R^2}{(R+h)^2} g_0 = \frac{1}{2} g_0$$
Solve for h to obtain $h = (\sqrt{2} + 1)R$
or $h = 0.414R$

Newton's Law of Universal Gravitation:

$$\frac{G m_{em}}{d^{2}} = \frac{G m_{mm} m}{(r_{em}-d)^{2}} \Rightarrow m_{m} d^{2} = m_{e} (r_{em}-d)^{2}$$

With $m_m = 0.0123 \, \text{me}$ and $r_{em} = 384398 \, \text{km}$, $d = 346022 \, \text{km}$ (between earth \$ moon) $d = 432348 \, \text{km}$ (to right of moon)
