Essential Cosmic Perspective 7th Edition Bennett Test Bank

MULTIPLE CHOICE. Choose the one alternative that best completes the statement or answers the question.

1) Which of the following statements about the celestial equator is true at <i>all</i> latitudes?	
---	--

 Which of the following statements about the celestial equator is true at <i>all</i> latitudes? A) It extends from your horizon due east, through your zenith, to your horizon due west. B) It represents an extension of Earth's equator onto the celestial sphere. C) It extends from your horizon due north, through your zenith, to your horizon due south. D) It lies along the band of light we call the Milky Way. E) It cuts the dome of your local sky exactly in half. 				
 2) When we look into the band of light in our sky that we call the Milky Way, can we see distant galaxies? Why or why not? A) No, because the stars, gas, and dust of the Milky Way block us from seeing them. B) Yes, there are many other galaxies that we see inside the Milky Way. C) Yes, they appear as small, fuzzy patches on the other side of our galaxy. D) No, because there are only galaxies above and below the plane of the Milky Way. 	2)			
 3) If it is midnight in New York, it is A) midnight everywhere. B) daytime in Sydney, Australia. C) midnight in Los Angeles. D) midnight in Sydney, Australia. E) midday in Rio de Janeiro, Brazil. 	3)			
4) How many arcseconds are in one degree? A) 100 B) 10,000 C) 3,600 D) 60 E) 360	4)			
 5) What is a <i>circumpolar</i> star? A) a star that is close to the north celestial pole B) a star that is close to the south celestial pole C) a star that is visible from the Arctic or Antarctic circles D) a star that always remains above your horizon E) a star that makes a daily circle around the celestial sphere 	5)			
 6) Which of the following statements about circumpolar stars is true at <i>all</i> latitudes? A) They make relatively small circles, traveling clockwise around the north celestial pole. B) They are the stars close to the north celestial pole. C) You cannot see them from the Southern Hemisphere. D) They always remain above your horizon. E) Like all other stars, they rise in the east and set in the west. 	6)			
 7) What makes the North Star, Polaris, special? A) It is the star straight overhead. B) It is the brightest star in the sky. C) It appears very near the north celestial pole. 	7)			

D) It can be used to determine your longitude on Earth.

E) It is the star directly on your northern horizon.

 8) You are standing on Earth's equator. Which way is Polaris, the North star? A) on the northern horizon B) 30 degrees up, due West C) directly overhead D) The answer depends on whether it's winter or summer. E) The answer depends on what time of day (or night) it is. 	8)
 9) By locating the north celestial pole (NCP) in the sky, how can you determine your latitude? A) The altitude of the NCP is the same as your distance from the North Pole. B) The altitude of the NCP is the same as your latitude. C) The altitude of the NCP is your angular distance from the North Pole. D) The direction of the NCP is the angular distance from the North Pole. E) The direction of the NCP is the same as your latitude. 	9)
 10) Orion is visible on winter evenings but not summer evenings because of A) baseball on television. B) the precession of Earth's axis. C) the tilt of Earth's axis. D) interference from the full moon. E) the location of Earth in its orbit. 	10)
 11) Why is it summer in the Northern Hemisphere when it is winter in the Southern Hemisphere? A) The Northern Hemisphere is tilted away from the Sun and receives more indirect sunlight. B) The Northern Hemisphere is "on top" of Earth and therefore receives more sunlight. C) The Northern Hemisphere is tilted toward the Sun and receives more direct sunlight. D) The Northern Hemisphere is closer to the Sun than the Southern Hemisphere. E) It isn't; both hemispheres have the same seasons at the same time. 	11)
 12) Which of the following statements is <i>true</i>? A) Both the Northern and Southern hemispheres receive the same amount of sunlight on the equinoxes. B) The Southern Hemisphere receives the most direct sunlight on the summer solstice. C) The Northern Hemisphere receives the most direct sunlight on the summer solstice. D) Both the Northern and Southern hemispheres receive the same amount of sunlight on the solstices. E) Both A and C are true. 	12)
 13) Which of the following statements about constellations is <i>false</i>? A) Most constellations will be unrecognizable hundreds of years from now. B) There are only 88 official constellations. C) It is possible to see all the constellations from Earth's equator. D) Some constellations can be seen in both the winter and summer. E) Some constellations can be seen from both the Northern and Southern hemispheres. 	13)
 14) Which of the following statements about lunar phases is <i>true</i>? A) It is possible to have two full moons during January, but not during February. B) The time from one new moon to the next new moon is the same as the time from first-quarter moon to third-quarter moon. C) The full moon sometimes rises around midnight. D) The time between new moons is two weeks. E) It is possible to have two full moons during November, but not during December. 	14)

This possible to have two rail moons daring revention, but not daring become

 15) Which of the following A) first-quarter model B) full moon C) third-quarter model D) half moon E) new moon 	pon	the Moon?			15)
 16) When someone on Ea facing Earth observes A) new Earth phase B) first-quarter Ear C) third-quarter Ear D) crescent Earth p E) full Earth phase. 	Earth in the e. rth phase. arth phase. hase.	10on in the first-qu	arter phase, someone	e on the Moon	16)
 17) If the Moon is setting a A) waning crescent B) first quarter. C) third quarter. D) new. E) full. 		se of the Moon mus	st be		17)
 18) If the Moon is setting a A) first quarter. B) third quarter. C) waning crescent D) waxing crescent E) full. 		of the Moon must	be		18)
 19) If the Moon is rising a A) first quarter. B) third quarter. C) waning crescent D) waxing crescent E) full. 		ase of the Moon mເ	ust be		19)
20) At approximately what A) 6 A.M.	at time would a fu B) midnight	ll moon be on your C) noon	meridian? D) 6 P.M.	E) 9 A.M.	20)
21) At approximately what A) 6 P.M.	at time would a fir B) midnight	st quarter moon ris C) 6 A.M.	e? D) noon	E) 9 A.M.	21)
 22) If the Moon rises arou A) waxing crescent B) full. C) waning crescent D) third quarter. E) first quarter. 		se must be			22)

23) In which direction does a quarter moon rise?A) southB) north	23)
C) east	
D) west	
E) The Moon becomes a quarter moon only after it has risen and changed phase.	
24) Which of the following statements about the Moon is true?	24)
 A) If you see a full moon from North America, someone in South America would see a new moon. 	
 B) The Moon is visible only at night. C) The Moon's distance from Earth varies during its orbit. 	
D) The Moon goes through a cycle of phases because it always has the same side facing Earth.	
E) The side of the Moon facing away from Earth is in perpetual darkness.	
25) What effect or effects would be most significant if the Moon's orbital plane were exactly the same	25)
as the ecliptic plane? A) Solar eclipses would be much rarer.	
B) Solar eclipses would be much more frequent.	
C) Total solar eclipses would last much longer.	
D) both A and C E) both B and C	
26) What conditions are required for a solar eclipse?	26)
A) The phase of the Moon can be new or full, and the nodes of the Moon's orbit must be nearly aligned with Earth and the Sun.	
B) The phase of the Moon must be full, and the Moon's orbital plane must lie in the ecliptic.	
C) The phase of the Moon must be new, and the Moon's orbital plane must lie in the ecliptic.	
D) The phase of the Moon must be full, and the nodes of the Moon's orbit must be nearly aligned with Earth and the Sun.	
E) The phase of the Moon must be new, and the nodes of the Moon's orbit must be nearly	
aligned with Earth and the Sun.	
27) What conditions are required for a lunar eclipse?	27)
A) The phase of the Moon can be new or full, and the nodes of the Moon's orbit must be nearly	
aligned with Earth and the Sun. B) The phase of the Moon must be new, and the nodes of the Moon's orbit must be nearly	
aligned with Earth and the Sun.	
C) The phase of the Moon must be full, and the Moon's orbital plane must lie in the ecliptic.D) The phase of the Moon must be new, and the Moon's orbital plane must lie in the ecliptic.	
E) The phase of the Moon must be full, and the modes of the Moon's orbital plane must be nearly	
aligned with Earth and the Sun.	
28) In addition to the conditions required for any solar eclipse, what must also be true in order for you	28)
to observe a <i>total</i> solar eclipse?	
 A) Earth must lie completely within the Moon's penumbra. B) The Moon's penumbra must touch the area where you are located. 	
C) Earth must lie completely within the Moon's umbra.	
D) Farth must be near appellion in its orbit of the Sun	

D) Earth must be near aphelion in its orbit of the Sun.E) The Moon's umbra must touch the area where you are located.

 29) If part of the full moon passes through Earth's umbra, we will see a(n) A) partial solar eclipse. B) annular eclipse. C) penumbral lunar eclipse. D) total lunar eclipse. E) partial lunar eclipse. 	29)
 30) If the Moon is relatively far from Earth, so that its umbra does not reach Earth, someone directly behind the umbra will see A) an annular eclipse. B) a partial solar eclipse. C) a partial lunar eclipse. D) no eclipse. E) a penumbral lunar eclipse. 	30)
 31) When are eclipse seasons? A) during an eclipse B) in the spring and fall C) when the nodes of the Moon's orbit are nearly aligned with the Sun D) when Earth, the Sun, and the Moon are exactly aligned for an eclipse E) in the summer and winter 	31)
 32) The precession of the Moon's nodes means that A) the vernal equinox will be in Aquarius in a few hundred years. B) there is a lunar eclipse every 6 months. C) the eclipse seasons occur less than 6 months apart. D) there are never two solar eclipses in the same year. E) there is a solar eclipse every 6 months. 	32)
 33) Ancient people who knew the saros cycle could A) predict what type of eclipse would occur. B) predict when they'd see the next total solar eclipse in their area. C) predict when an eclipse would happen, but not necessarily what type and where it would be visible. D) completely predict every solar eclipse. E) completely predict every lunar eclipse. 	33)
34) What happens during the apparent retrograde motion of a planet?A) The planet appears to move eastward with respect to the stars over a period of many nights.B) The planet moves through constellations that are not part of the zodiac.C) The planet moves backward in its orbit around the Sun.	34)

- D) The planet moves backward through the sky.
- E) The planet rises in the west and sets in the east.

35) What causes the appa	rent retrograde motio	on of the planets?			35)
 35) What causes the apparent retrograde motion of the planets? A) Apparent retrograde motion is an illusion created by turbulence in Earth's atmosphere. B) When planets are farther from the Sun, they move slower than when they are nearer the Sun; it is during this slower period that they appear to move backwards. C) As Earth passes another planet, the other planet appears to move backward with respect to the background stars, but the planet's motion does not really change. D) The other planets never really appear to move backward; the background stars shift due to 					
Earth's revolution E) As Earth passes	on around the Sun.		vs down the other pla		
36) Which of the followingA) Venus	g never goes in retroç B) Saturn	grade motion? C) the Sun	D) Mars	E) Jupiter	36)
37) Which of the following	g statements about p	arallax is <i>not</i> true?			37)
 A) The existence of B) Measurement of C) The technique of Galaxy (M 31) is D) Ancient astronomic parallax as an article 	stellar parallax is dir f stellar parallax allov f stellar parallax was about 2 million light mers were unable to gument in favor of a strate parallax simply	ect proof that Earth vs us to determine c used by Hubble to t-years away. measure parallax ar n Earth-centered ur	listances to nearby sta determine that the Ar nd used the absence o	idromeda f observed	
B) The closer a star C) It takes at least 1 D) The amount of p	tars to exhibit at leas is to us, the more pa 0 years of observatic	t a slight amount of rallax it exhibits. on to measure a star nds on how fast a sta	parallax. 's parallax. ar is moving relative t	0 US.	38)
39) We can't detect stellar	parallax with naked			g would make	39)
B) getting away fro	arth's orbital motion om streetlights precession of Earth's th's orbital motion	s axis			
B) They did not locC) They could not sD) They did not ob	ve the ability to meas ok for it.	sure very small angl h periods of time.	es.		40)
41) How many arcsecond A) 60	s are in one arcminu B) 10,000	te? C) 100	D) 3600	E) 360	41)
42) How many arcminute A) 60	es are in one degree? B) 100	C) 3600	D) 10,000	E) 360	42)

	43) Has Polaris always been the "North Star"?				
	 A) No, because it is a young star that only formed a few hundred years ago. B) No, because the Earth's axis slowly changes the direction it points. C) No, because the Milky Way blocked our line of site to it for a long time. D) Yes, because the stars are unchanging. 				
	44) If you see Polaris directly overhead at midnight, you must be at	44)			
	A) the South Pole.B) the North Pole.C) the equator.D) the Tropic of Cancer.				
	 45) You experience night-time when A) the side of the Earth you occupy is facing away from the Sun. B) the Earth's axis precesses. C) the Earth revolves 90 degrees in its orbit. D) the Moon blocks the Sun's light. 	45)			
	46) If the Moon is setting at noon, then it rose at A) noon.B) 6 A.M.C) 6 P.M.D) midnight.E) 9 A.M.	46)			
TRUE	FALSE. Write 'T' if the statement is true and 'F' if the statement is false.				
	47) In South Africa, it's usually quite warm around the time of the December solstice and quite cool around the time of the June solstice.	47)			
	48) You can find the tilt of Earth's axis by measuring the angle between your horizon and the North Star.				
	49) The Milky Way can be seen only from the Northern Hemisphere.	49)			
	50) The seasons on Earth are caused by its elliptical orbit around the Sun.	50)			
	51) At midnight it is sometimes possible to observe the crescent moon on the meridian.	51)			
	52) It is possible to see the third-quarter moon near the western horizon at sunrise.	52)			
	53) It is possible to see the full moon rising just before sunrise.	53)			
	54) If you lived on the Moon, you'd see full Earth when we see new moon.	54)			
	55) It is possible to view the Moon in first-quarter phase the day after a total lunar eclipse.	55)			
	56) The Moon and the Sun are approximately the same angular size.	56)			
	57) A solar eclipse occurs only when the Moon is new.	57)			
	58) A lunar eclipse occurs only when the Moon is new.	58)			
	59) The Moon and Sun are approximately the same physical size.	59)			

ESSAY. Write your answer in the space provided or on a separate sheet of paper.

- 60) *Models in Science*: Models play a central role in astronomy and science in general. Two models used extensively in this chapter are the celestial sphere and the heliocentric (Sun-centered) model for the solar system. Astronomers clearly believe that the celestial sphere model is *false* and the heliocentric model is *true*. Given this, why do you think astronomers persist in using the celestial sphere model to describe the night sky?
- 61) Cognitive Dissonance? You are talking to a friend who insists that the seasons are caused by a varying Earth-Sun distance over the course of a year. What other fact does your friend likely know that completely contradicts this view of how the seasons are caused? Can you think of other examples of two beliefs that many people feel are both true but which completely contradict each other? How does science view this situation?
- 62) *The Sidereal Day*: Using your wristwatch and observations of the night sky over the course of a few weeks, how can you demonstrate to a friend that 24 hours cannot be the true rotation period of the Earth (often called the sidereal day)? What assumptions do you make in this argument?
- 63) *Scientific Reasoning*: The scientific method requires that we put any hypothesis about how the universe works to the test by conducting observations of the natural world. Consider the Greek reaction to the idea of a heliocentric (Sun-centered) solar system. Why did most Greeks reject this hypothesis in favor of the geocentric (Earth-centered) model? Do you think that the Greeks were following a scientific form of reasoning to reach this conclusion? Does the fact that the Greeks reached the *wrong* conclusion affect your answer?

SHORT ANSWER. Write the word or phrase that best completes each statement or answers the question.

The choices below are for the following questions. For each question, choose the letter for the real motion that is responsible for the apparent motion as seen from Earth.

- A. Earth rotates once each day.
- B. Earth revolves around the Sun once each year.
- C. The direction of Earth's axis in space precesses with a period of 26,000 years.
- D. Stars appear to move randomly in the local solar neighborhood.
- E. The universe is expanding.

64) Polaris will no longer be the North Star 1,000 years from now.	64)
65) In the year A.D. 15,000, Vega will be a better north star than Polaris.	65)
66) The Big Dipper will look different 100,000 years from now than it does today.	66)
67) The Moon rises in the east and sets in the west.	67)
68) The stars of Orion's belt rise in the east and set in the west.	68)
69) A million years from now, Alpha Centauri will no longer be the nearest star system to our	69)
own.	, <u> </u>
70) The stars visible at night change over the course of the year.	70)
71) The stars visible just after sunset are different from those visible just before sunrise.	71)

72) If Earth's axis had no tilt, would we still have seasons? Why or why not?	72)
73) Consider the following statement, and explain whether or not it is sensible: If you had a very fast spaceship, you could travel to the celestial sphere in about 100 years.	73)
74) Consider the following statement, and explain whether or not it is sensible: When I looked into the dark fissure of the Milky Way with my binoculars, I saw what must have been a cluster of distant galaxies.	74)
75) Why does the Milky Way appear as a band of light in the sky?	75)
76) Consider the following statement, and explain whether or not it is sensible: Although all the known stars appear to rise in the east and set in the west, we might someday discover a star that will appear to rise in the west and set in the east.	76)
77) At what altitude and in what direction in your sky does the north or south celestial pole appear?	77)
78) Consider the following statement, and explain whether or not it is sensible: My sign is Ursa Major because the Sun was in Ursa Major when I was born.	78)
79) Consider the following statement, and explain whether or not it is sensible: Last night I saw Jupiter in the constellation Ursa Major.	79)
 80) Answer each of the following questions for our local sky. A. Where is the north celestial pole in our sky? B. Is Polaris a circumpolar star in our sky? Explain. C. Describe the meridian in our sky. D. Describe the celestial equator in our sky. 	80)
81) Consider the following statement, and explain whether or not it is sensible: If you lived on the Moon, you'd see full Earth when we see new moon.	81)
82) Suppose you lived on the Moon near the center of the face that we see from Earth. During the phase of full moon, what phase would you see for Earth? Would it be day or night at your home?	82)
83) Suppose you lived on the Moon near the center of the face that we see from Earth. During the phase of new moon, what phase would you see for Earth? Would it be day or night at your home?	83)
84) Suppose you lived on the Moon near the center of the face that we see from Earth. At what phase of the Moon would you see sunset? What phase of Earth would you see at this time?	84)
85) Suppose you lived on the Moon near the center of the face that we see from Earth. At what phase of the Moon would you see sunrise? What phase of Earth would you see at this time?	85)

86)	What would you see if you were on the near side of the Moon during a lunar eclipse?	86)
87)	Why is the Moon <i>not</i> completely invisible (it appears as a very deep red color) to the naked eye during a total lunar eclipse?	87)
88)	What would you see on Earth if you were on the near side of the Moon during a solar eclipse?	88)
89)	Suppose the distance to the Moon were twice its actual value. Could we still have solar eclipses? If so, what type(s)?	89)
90)	Consider the following statement, and explain whether or not it is sensible: Last night I saw Mars move westward through the sky in its apparent retrograde motion.	90)
MULTIPI	LE CHOICE. Choose the one alternative that best completes the statement or answers the	question.
91)	 If the Earth's rotation axis were tilted by 45 degrees instead of 23.5 degrees, what are some of implications, and why? A) The seasons would be more extreme, because the surface of the Earth would be closer to Sun in the summer, and farther from the Sun in the winter. B) The seasons would be more extreme, because the Sun's rays would be more direct in summer, and less direct in winter. C) The seasons would be less extreme, because the surface of the Earth would be farther from the Sun in the summer, and closer to the Sun in the winter. D) The seasons would be less extreme, because the Sun's rays would be less direct in summary and closer to the Sun in the winter. 	o the
92)	You see a crescent Moon setting after the Sun sets. Is it waning or waxing? A) can't distinguish based on the information provided B) waning C) waxing	92)
93)	 Tonight, your telescope shows you RXJ1800, a galaxy, very near in the sky to the bright star WWhat can you conclude from this observation? A) Vega and RXJ1800 must be very close to each other, less than a few light years. B) Vega orbits the center of mass of RXJ1800. C) RXJ1800 and Vega will drift apart from each other on the sky, over a matter of nights. D) RXJ1800 and Vega will set in the west, at very similar times. 	′ega. 93)
94)	If the Sun passes almost in front of the center of our Milky Way Galaxy, it does so A) only in 2012, at the end of the Mayan calendar. B) once a day. C) once a year. D) once a month.	94)
95)	 The Greeks rejected the notion that the Earth orbits the Sun. Why? A) They could not measure a change in stars' positions on the sky. B) They believed that the Sun is a God. C) They weren't as smart as we are. 	95)

D) They could not measure how big the Earth was.

96)	 96) Your friend tells you that last night, they saw Mars high in the sky at midnight. You conclude that A) Mars must be in retrograde. B) Mars must be at its farthest distance from the Earth. C) Mars must be at its closest distance from the Sun. D) Your friend must be mistaken: Mars can never be seen at midnight. 				96)		
97)	If the Moon is 3rd qua A) sunset	rter phase, wher B) noon	n does it rise? C) never	- [D) sunrise	E) midnight	97)
98)	The Moon's orbit arou the Sun. As a result, th approximately						98)
	A) 24.	B) 0.		C) 2.		D) 12.	
99)	During a lunar eclipse A) full.	the Moon's phas B) 1st qua		C) new.		D) 3rd quarter.	99)
100)	If the Moon is 3rd qua A) a full circle	rter phase, what	shape does it	have in the s	ky?		100)
	A) a full circleB) a half circleC) a quarter circleD) nothing (It is implicit)	cossible to view a	a 3rd quarter i	moon.)			
101)	Which planet is movin A) Earth B) Venus C) Jupiter D) They are all mov						101)
102)	Which of these (hypot A) Make the Moon B) Change the orbin Sun.	hetical) modifica orbit the Earth ty tal plane of the N	tions would c wice as fast. 10on so it lies	ause lunar ec in the same p	plane as Earth		102)
	C) Change the Moc D) Relocate the Mo	•					
103)	The Moon is nearly tic the same as its orbital experience (approxim A) (14 × 24) hours o B) sunshine (day) a C) 14 hours of dark D) sunshine all the	period. If you we ately) If darkness follov II the time. ness followed by	ere camped at ved by (14 × 2 v 14 hours of s	the equator 4) hours of si unshine.	of the Moon, <u>y</u> unshine.	•	103)
104)	"Gibbous" means a ne will I see in one week? A) waxing crescent C) waning gibbous	-	f I see a waxin	g gibbous mo B) waning D) waxing	crescent	/hat moon phase	104)

105) Which of the following conditions must exist for a solaA) The only condition is that the phase of the MoonB) Moon phase is full, and the Moon is passing throC) The only condition is that the phase of the MoonD) Moon phase is new, and the Moon is passing thro	must be full. bugh the Earth's orbital plane. must be new.	105)
106) Which of the following situations would result in the lean axis tilt of 0 degrees is an axis perpendicular to the A) axis tilt -10 degreesC) axis tilt 23.5 degrees		106)
107) About how many stars are visible to the naked eye onA) a few dozenC) a couple thousand	a clear, dark night away from city lights? B) a few hundred billion D) several million	107)
 108) What do astronomers mean by a <i>constellation</i>? A) A constellation is a region in the sky as seen from Earth. B) A constellation is a group of stars related through an ancient story. C) A constellation is a group of stars that are all located in about the same place in space. D) A constellation is any random grouping of stars in the sky. 		108)
 109) What is the <i>ecliptic</i>? A) a half-circle extending from your horizon due not due south B) the path traced by the Moon's shadow on Earth C) the path the Sun appears to trace around the cele D) the Sun's daily path from east to west in our sky 	during a solar eclipse	109)
 110) What is the <i>celestial sphere</i>? A) The celestial sphere is a model of how the stars a which is in the middle of the sphere. B) It represents a belief in an Earth-centered univer have any use. C) The celestial sphere is a representation of how the D) The celestial sphere is a model that shows the true thousand of the nearest stars. 	rse, and hence is no longer considered to he entire sky looks as seen from Earth.	110)
 111) What do we mean when we talk about the <i>Milky Way</i> A) the whitish patch of light we see when we look to B) the patchy band of light that outlines the <i>plane</i> of C) the spiral-shaped galaxy in which we live D) the bright stars of the constellations that lie along 	oward the <i>center</i> of the Milky Way Galaxy the Milky Way Galaxy as seen from Earth	111)
 112) Which of the following statements does <i>not</i> use the ter A) The angular size of the Sun is about the same as B) The angular distance between those two brights C) You can use your outstretched hand against the distances. D) The angular distance between those two houses 	that of the Moon. tars in the sky is about 2 meters. sky to estimate angular sizes and angular	112)

 113) Which of the following correctly describes the <i>merida</i> A) a half-circle extending from your horizon due due south B) the point directly over your head C) a half-circle extending from your horizon due west D) a half-circle extending from your horizon due horizon due west 	north, through your zenit east, through your zenith	to your horizon due	113)
114) The point directly over your head is calledA) the north celestial poleC) the North Star	B) the zenith D) the meridian		114)
115) Stars that are visible in the local sky on any clear nig called	ht of the year, at any time	of the night, are	115)
A) bright B) seasonal	C) celestial	D) circumpolar	
116) We describe a location on <i>Earth's surface</i> by stating itA) meridian and longitudeC) latitude and longitude	s B) altitude and direction D) latitude and direction		116)
 117) If you are located in the Northern Hemisphere, which relationship between the sky and your location? A) The altitude of the celestial equator equals you B) The altitude of the north celestial pole equals y C) The altitude of the north celestial pole equals y D) The longitude of the north celestial pole is circulated the meridian. 	r latitude. our longitude. our latitude.	-	117)
 118) Which of the following best describes why we have a A) The varying speed of Earth in its orbit around fastest and winter when we are moving slowes B) The tilt of Earth's axis causes different portions sunlight at different times of year. C) Earth's elliptical orbit means we are closer to th sunlight at some times of year than at others. D) The tilt of Earth's axis causes the northern hem southern hemisphere in summer, and vice verse 	the Sun gives us summer st. of the Earth to receive m ne Sun and therefore recei isphere to be closer to the	ore or less direct ve more intense	118)

119) Each choice below describes how a few astronomica		119)
Which list is entirely correct? (Careful: some lists are	e partially correct.)	
A) Earth's rotation defines a day.		
The cycle of the Moon's phases takes about a v	week.	
Earth's orbit defines a year.		
Earth's cycle of axis precession defines a mont	th.	
B) Earth's rotation defines a day.		
The Sun's rotation defines a week.		
The Moon's rotation defines a month.		
Earth's orbit defines a year.		
C) Earth's rotation defines a day.		
The saros cycle of eclipses defines a month.		
Earth's orbit defines a year.		
Earth's cycle of axis precession takes 26,000 ye	ears.	
D) Earth's rotation defines a day.		
The cycle of the Moon's phases takes about a r	month.	
Earth's orbit defines a year.		
Earth's cycle of axis precession takes 26,000 ye	ears.	
120) If we have a new moon today, when we will have t	he next full moon?	120)
A) in about 2 weeks	B) in about 1 month	,
C) in about 1 week	D) in about 6 months	
121) We cannot see a new moon in our sky because	·	121)
A) it is above the horizon during the daytime		·
B) a new moon is quite near the Sun in the sky		
C) no sunlight is illuminating the Moon		
D) it is obscured by Earth's shadow		
122) Lunar eclipses can occur only during a		122)
A) third quarter moon	B) full moon	
C) new moon	D) first quarter moon	
123) What is the saros cycle?		123)
A) the annual cycle of the seasons		
B) the roughly 18-year cycle over which the patt	ern of eclipses repeats	
C) the roughly one-month cycle of lunar phases	in the sky	
D) the 26,000-year cycle of the Earth's precession	1	
124) During the time that a planet is in its period of <i>appai</i>	rant ratrograda mation	124)
A) the planet appears to rise in the west and set i		124)
east and setting in the west		
B) the planet is getting closer to the Sun in its orb	sit	
C) over many days or weeks, the planet moves v		
usual eastward relative to the stars		
	wood from above Earth's parth pale) in its arbit	
D) the planet moves backwards (clockwise as vie of the Sun	יייפט חטווו מסטיפ במונוז s חטונוז pole) ווו ונs orbit	

 125) What is <i>stellar parallax</i>? A) It is the slight back-and-forth shifting of star positions that occurs as we view the stadifferent positions in Earth's orbit of the Sun. B) It is the daily rise and set of the stars. C) It is the change in the set of constellations that we see at different times of year in the sky. D) It describes the fact that stars are actually moving relative to one another, even those eyes the stars appear fixed in the constellations. 	ne evening
 126) Which of the following statements about the celestial sphere is <i>not</i> true? A) When we look in the sky, the stars all appear to be located on the celestial sphere. B) The celestial sphere does not exist physically. C) The Earth is placed at the center of the celestial sphere. D) The "celestial sphere" is another name for our universe. 	126)
 127) The Andromeda Galaxy is faintly visible to the naked eye in the constellation Andromed Suppose instead it were located in the same direction in space as the center of the Milky V Galaxy (but still at its current distance). How would it appear to the eye in that case? A) It would look about the same, but it would be harder to pick out because its cloud-I appearance would make it blend in with the cloud-like appearance of the Milky V sky. B) It would be much brighter because it would be illuminated by the many stars in the our galaxy. C) We could not see it at all. D) It would look about the same, but would be in the constellation Sagittarius instead of Andromeda. 	Way like ay in our e center of
 128) An angle of 1 arcsecond is A) about the width of a finger held at arm's length B) about the width of your fist held at arm's length C) slightly more than the width of a basketball held at arm's length D) less than the thickness of a human hair held at arm's length 	128)
 129) When traveling north from the United States into Canada, you'll see the North Star (Pola getting A) dimmer B) higher in the sky C) brighter D) lower in the sky 	ris) 129)
 130) Suppose you use the Southern Cross to determine that the south celestial pole appears 40 above your horizon. Then you must be located at A) latitude 40 degrees south C) longitude 40 degrees D) latitude 50 degrees south) degrees 130)
 131) Suppose you are facing north and you see the Big Dipper close to your northern horizon, Polaris (and the Little Dipper) above it. Where will you see the Big Dipper in six hours? A) still in the same place, below Polaris B) directly above Polaris C) to the right of Polaris; that is, 90 degrees counterclockwise from its current position D) to the left of Polaris; that is, 90 degrees clockwise from its current position 	with 131)

132) In any particular place on Earth, certain constellation times of the year because	is are visible in the evening only at certain	132)
A) some constellations are circumpolar		
B) our evening view of space depends on where I	Earth is located in its orbit around the Sun	
C) on any particular night, we can only see stars t		
from) the Sun in the sky		
D) during some times of year, some constellations	drop below the southern horizon	
133) The Sun's path, as viewed from the equator, is highe	-	133)
 A) the spring and fall equinoxes 	B) the winter solstice	
C) the summer solstice	D) the day when Earth is closest to the Sun	
134) Suppose Earth's axis tilt was significantly greater that	n its current 23.5 degrees, but Farth's rotation	134)
period and orbital period were unchanged. Which st	-	
A) Polaris would not be our North star.		
B) Summers and winters would be more severe (for example botter and colder respectively.	
than they are now.	or example, notice and colder, respectively)	
C) The length of each season (for example, the nu	mber of days from the summer solstice to the	
fall equinox) would be significantly longer that		
D) The region of Earth where the Sun does not ris		
(extending farther south) than it is now.	5	
135) If our year were twice as long (that is, if Earth took to	vice as many days to complete each arbit	135)
around the Sun), but Earth's rotation period and axis		155)
A) stars would take twice as long to rise and set	the were unchanged, then	
-		
B) the Earth would not have seasons	instead of 24,000 years	
C) the cycle of precession would take 13,000 years	.	
D) the four seasons would each be twice as long a	s they are now	
136) How does Earth's varying distance from the Sun affe	ect our seasons?	136)
 A) It doesn't—Earth's orbital distance plays no sig 	nificant role in the seasons.	
B) It causes the seasons to be more extreme than	hey would be if the Earth's distance from the	
Sun were always the same.	-	
C) It is responsible for the fact that the seasons are	e opposite in the Northern and Southern	
hemispheres.		
D) It makes summer warmer in the Northern Her	nisphere than in the Southern Hemisphere.	
137) Suppose you live in the United States and you see a	crescent moon in vour evening sky tonight	137)
What will a friend in South America see tonight?		
A) Your friend will see a gibbous moon.		
B) Your friend won't see the Moon tonight, becau	se it is up only in the morning.	
C) Your friend will also see a crescent moon.		
D) Your friend will see a first quarter moon.		
,		
138) Suppose it is full moon. What phase of Earth would	someone on the Moon see at this time?	138)
A) first quarter Earth		
B) new Earth		
C) full Earth		

D) Earth does not go through phases as seen from the Moon.

139) It's 6 a.m. and the Moon is at its highest point in your sky (crossing the meridian). What is the			139)		
Moon's pha A) third c		B) new	C) first quarter	D) full	
140) You observe	e a full moon ris	ing at sunset. Wh	at will you see at midnight?		140)
•	quarter moon ing gibbous mo	on	B) a third quarter mo D) a full moon high i		
	-	s are true. Which	one explains the reason that th	ere is <i>not</i> a solar eclipse	141)
B) The no C) The M	loon is only abc odes of the moc loon goes throu	n's orbit precess v gh a complete cyc	Earth in diameter. vith an 18-year period. le of phases about every 29 1/2 lightly (by about 5 degrees) to	-

- 69) D
- 70) B
- 71) A
- 72) We would no longer have seasons, because the Sun's light would hit at the same angle all throughout the year, depending only on where you lived. The slight change in distance between Earth and the Sun during the year would not produce much of an effect.
- 73) This statement does not make sense because the celestial sphere is a concept and not a physical object.
- 74) This statement does not make sense because we cannot see through the band of light we call the Milky Way to external galaxies; the dark fissure is gas and dust blocking our view.
- 75) The solar system lies in the outer parts of the thin disk of a spiral galaxy. Thus when we look along the plane of the disk, we see large numbers of stars that, to the naked eye, merge into a band of light. When we look out of the plane of the disk, there are very few stars and the night sky is much darker.
- 76) This statement does not make sense. The stars aren't really rising and setting, they only appear to rise in the east and set in the west because Earth rotates.
- 77) Answers will vary with your latitude; latitude = altitude of NCP (or SCP in Southern Hemisphere).
- 78) Not sensible: The Sun appears only in the constellations of the zodiac-and Ursa Major is not one of these.
- 79) This statement does not make sense because Jupiter, like all the planets, is always found very close to the ecliptic in the sky. The ecliptic passes through the constellations of the zodiac, so Jupiter can appear to be only in one of the 12 zodiac constellations—and Ursa Major is not one of these.
- 80) A. Answers will vary with latitude; here is a sample for 40°N: The north celestial pole appears at an altitude of 40°, in the direction due north.

B. Yes, for any location in the Northern Hemisphere; no, for any location in the Southern Hemisphere. Polaris is circumpolar because it never rises or sets in our sky. It makes a daily circle, less than 1° in radius, around the north celestial pole.

C. The meridian is a half-circle that stretches from the due south point on the horizon, through the zenith, to the due north point on the horizon.

D. Answers will vary with latitude; here is a sample answer for 40°N: The celestial equator is a half-circle that stretches from the due east point on the horizon, through an altitude of 50° due south, to the due west point on the horizon.

- 81) This is true, because at full moon Earth lies between the Sun and the Moon. Thus, an observer on the Moon would be looking at the night side of Earth.
- 82) During the full moon, it would be daytime and you would see the phase of new Earth.

- 83) During the new moon, it would be nighttime and you would see the phase of full Earth.
- 84) Sunset would occur at the Moon's third-quarter phase. You would see Earth in first-quarter phase at this time.
- 85) Sunrise would occur at the Moon's first-quarter phase. You would see Earth in third-quarter phase at this time.
- 86) During a lunar eclipse, you would see Earth pass in front of the Sun. It would be completely dark where you were.
- 87) The Moon shines through reflected light from the Sun and thus it becomes very dark during a lunar eclipse since the Moon lies within Earth's shadow at this time. However, some sunlight still gets through because it is bent (similar to the way a lens works) by Earth's atmosphere. We see the reflection of this faint light and thus the Moon is not completely invisible. (The bending of light is called *refraction* and the effect is strongest at long wavelengths. Thus it is most pronounced for red light and the eclipsed Moon appears dark red.)
- 88) During a solar eclipse, you would see a small circular shadow traveling across a portion of Earth's surface.
- 89) If the Moon were twice its actual distance from us, we would no longer be able to see total solar eclipses because the Moon would not be able to completely cover the surface of the Sun; however, we would still see partial and annular eclipses, although the Moon would not block as much of the Sun during these times.
- 90) This statement does not make sense because the apparent retrograde motion is noticeable only over many nights, not during a single night. (Of course, like all celestial objects, Mars moves from east to west over the course of every night.)
