## **Chapter 2: Research Design**

SI = section introduction

1. Research methodology is the science of methods for investigating phenomena (SI). Ans: T

2. The purpose of applied research is to develop new knowledge about phenomena such as problems, events, programs, or policies, and their relationships (SI).

3. Research begins by asking questions (SI).

Ans: T

4. Quantitative research methods involve the collection of data that can be analyzed using statistical methods (SI).

Ans: T

5. Both quantitative and qualitative methods are indispensable in addressing questions of basic and applied research (SI).

Ans: T

6. Research is fundamentally about establishing the nature of things.

Ans: T

7. Variables are defined as empirically observable phenomena that vary.

Ans: T

8. Attributes are defined as observable phenomena that do not vary.

Ans: F

9. Descriptive analysis provides information about the nature of variables.

Ans: T

10. Relationships involve specifying which variables are related to each other, and the ways in which they are related to each other.

Ans: T

11. Relationships in social science are usually deterministic in nature.

Ans: F

12. A single exception will normally disprove claims about relations in social science.

Ans: F

13. Relationships also are distinguished as being either causal or associational.

Ans: T

14. Distinguishing between independent and dependent variables is a cornerstone of research. Ans: T

15. Causation requires both (1) empirical (i.e., statistical) correlation and (2) a plausible cause-and-effect argument.

Ans: T

16. A theory exists for just about every relationship in social science.

Ans: F

17. Program evaluation involves three steps.

Ans: F

18. Control variables are always dependent variables.

Ans: F

19. Rival hypotheses are plausible counter explanations for relationships that are found.

Ans: T

20. Classic experimental designs are widely used in public management and policy for determining the effect of new policies and programs.

Ans: F

21. Statistics is the only way for dealing with rival hypotheses.

Ans: F

22. If X causes Y (or in notation,  $X \to Y$ ), then X is called the dependent variable because it affects Y.

Ans: F

23. Threats to external validity are defined as those that jeopardize the generalizability of study conclusions about program outcomes to other situations.

Ans: T

24. Threats to internal validity are those that jeopardize the study conclusions about whether an intervention in fact caused a difference in the study population.

Ans: T
