Essay

144. The U.S. economy is the largest in the world. What two factors primarily explain this? What makes the U.S. economy unique?

ANSWER: Sheer size of the country, with a population of about 320 million and a labor force of 144 million, contributes to the large production. But this cannot be the only element, or India's GDP would be three times as large. Efficiency is the second factor the U.S. economic system transforms inputs into output in a much more productive fashion. U.S. success is attributable to the free enterprise market system.

What makes the U.S. economy unique is its combination of prosperity and population. While there are several countries that are rich in terms of per capita GDP, they are relatively small because of their small population and geographic size. Other countries have immense populations, but have not achieved economic prosperity in terms of per capita GDP.

145. Differentiate between an open and a closed economy? Do you agree that US economy is more open among the advanced industrial countries in the world?

ANSWER: An economy is called relatively open if its exports and imports constitute a large share of its GDP. An economy is considered relatively closed if they constitute a small share.

No. The United States stands out as among the most closed economies of the advanced, industrial nations. We export and import a smaller share of GDP than nearly all advanced industrial nations.

146. What important changes have occurred in the composition of the labor force since 1960? Is the popular image of the American worker as a factory worker accurate? Describe the types of jobs Americans are working in today.

ANSWER: The most important change is the increasing participation of women, who composed 30 percent of the labor force in 1960 but now account for more than half. This has led to discussions of wage discrimination against women and questions of parental leave. A second trend is a declining percentage of teenagers in the labor force, after peaking in the early 1970s. Teenagers typically hold entry-level jobs, suggesting why these jobs must be increasingly filled by other segments of the labor force (McDonalds may be hiring the elderly not just for public relations but due to the unavailability of youthful workers).

In 2013, just over 70 percent of American workers were employed in service-related industries, whereas only about 14 percent produced goods. Service workers included about 21.1 million in educational and health services, about 18.6 million in business and professional services, and over 15 million in retail trade. Manufacturing companies in the United States employed only 12 million people, and almost a third of those worked in offices rather than in the factory.

147. Between 1960 and 2013 U.S. GDP, measured in dollars of constant purchasing power, expanded about 5.0 times. However, the standard of living only increased by 4 times over this period. Explain the difference.

ANSWER: GDP growth includes the effects of inflation and population growth, meaning there are more labor inputs in the economy. The standard of living is better measured by real GDP per capita. To obtain the standard of living from GDP, one must correct for the effect of population growth.

149. Is the image of the typical American worker as a blue-collar worker true? Substantiate your answer with facts.

ANSWER: The Homer Simpson image of the typical American worker as a blue-collar worker is really quite misleading. The majority of American workers, like workers in all developed countries, produce services, not goods. In 2013, about 70 percent of all non-farm workers in the United States were employed by private service industries, whereas only 14 percent produced goods. By contrast, manufacturing companies in the United States employed only 12 million people, and almost a third of those worked in offices rather than in the factory.

150. How does the United States compare to other nations on a per capita scale as far as government production and taxation?

ANSWER: Government production as a share of GDP is relatively low compared with other countries. Perhaps more surprising is that U.S. citizens are perhaps the most lightly taxed, at 30 percent of GDP. The cry for "No more taxes" may reflect a concern with government inefficiency, but Americans are mistaken if they believe their tax burden is high compared to other countries.

151. It is often asserted that the United States no longer manufactures anything, and that instead it imports manufactured goods from countries like China. Critically evaluate this claim.

ANSWER: If the claim were true then the share of GDP that the U.S. imports would have to be extremely high given the share of goods versus services in the U.S. economy. If we look at the data, only about 13 percent of U.S. GDP is imported and imports from China account for about one fifth of this. That means that over 80 percent of what Americans consume is made in the United States. Therefore this claim is false.

152. A nation's citizens often dislike the economy's distribution of income. Explain two methods for creating a more equal distribution of income.

ANSWER: One method is to override the market distribution to force a more equal distribution of incomes. A second method, that is used to varying degrees in virtually all of the private-enterprise economies, is to use transfer payments, sums of money that individuals receive from the government without providing any goods or services in return. By taxing wealthier individuals and giving transfer payments to poorer individuals, a more equal distribution of after-tax income may be achieved.

154. All industrialized countries have become "service economies" in recent decades. Explain the reasons behind this shift.

ANSWER:

To a considerable degree, this shift to services reflects the arrival of the "Information Age." Activities related to computers, to research, to the transmission of information by teaching and publication, and other information-related activities are providing many of the new jobs. Technological change has also made it possible to produce more and more manufactured products using fewer and fewer workers. Such labor-saving innovation in manufacturing has allowed a considerable share of the labor force to move out of goods-producing jobs and into services.
