Microbiology with Diseases by Body System 4th Edition Bauman Test Bank

Exam						
Name_						
MULT	IPLE CHOICE. Choos	e the one alternativ	re that best complete	s the statement or an	swers the questio	n.
	1) Which of the follow charge?	ving is a particle fou	nd in the nucleus of a	an atom and that has	no electrical	1)
	A) neutron Answer: A	B) element	C) electron	D) isotope	E) proton	
	2) Matter composed of A) mineral. B) electron. C) molecule. D) element. E) compound. Answer: D	f a single type of ato	om is known as a(n)			2)
	3) A stable atom has _ A) 4 electrons B) 2 neutrons C) 10 electrons D) 8 protons E) 8 electrons	in its valen	ce shell.			3)
	Answer: E					
	4) Which parts of the A) ions Answer: B	atoms interact in a c B) electrons	hemical reaction? C) neutrons	D) isotopes	E) protons	4)
	5) 6p					5)
	The outer ring in Fi A) a neutron. B) the nucleus. C) an electron. D) an isotope. E) an electron sh Answer: E	gure 2–1 represents ell.				

6) The valence of an atom represents its	6)
A) electronegativity.	· ·
B) ability to interact with other atoms.	
C) radioactivity.	
D) ability to interact with water.	
E) ability to attract electrons.	
·	
Answer: B	
7) The type(s) of hands produced when stoms share electrons equally is/are	7)
7) The type(s) of bonds produced when atoms share electrons equally is/are	7)
A) a hydrogen bond.	
B) a nonpolar covalent bond.	
C) an ionic bond.	
D) a polar covalent bond.	
E) both polar covalent and ionic bonds.	
Answer: B	
	0.
8) The type(s) of bond produced when atoms with somewhat different electronegativities share	8)
electrons is/are	
A) an ionic bond.	
B) a nonpolar covalent bond.	
C) a polar covalent bond.	
D) a hydrogen bond.	
E) both nonpolar covalent and ionic bonds.	
Answer: C	
9) A research microbiologist wants to determine whether a microbe can metabolize a new synthetic	9)
)) <u> </u>
organic molecule composed of carbon, hydrogen and oxygen. Which of the following would be	
useful in tracing the fate of the compound?	
A) the ² H isotope	
B) the 13 C isotope	
C) a ¹³ C+ ion.	
D) the ¹⁴ C isotope	
E) the ¹² C isotope	
Answer: D	
Allower. D	
10) Unstable isotopes can be useful	10)
A) in medical diagnosis.	,
B) in vitamins.	
C) in the formation of hydrogen bonds.	
D) catalysts.	
E) as buffers.	
Answer: A	
Allswer: A	
11) Which of the following is a CORRECT pairing of metabolic terms?	11)
A) hydrolysis: decomposition	, <u> </u>
B) synthesis: exothermic	
C) synthesis: catabolism	
D) catabolism: endothermic	
E) dehydration: decomposition	
, , , , , , , , , , , , , , , , , , ,	

Answer: A

12) Compounds that	readily dissociate in	water are			12)
A) ionic.	•				
B) polar.					
C) nonpolar.					
D) either polar	or ionic.				
E) never polar					
Answer: D					
13) Which of the follo	owing is a property o	f water?			13)
A) It is a nonpo					,
_	capacity for heat.				
C) It is not a go					
_	n a very narrow temp	erature range.			
	mmon reactant in m				
Answer: B					
14) An acid dissociate	es in water to release				14)
A) hydroxyl gr					,
B) anions.	1				
C) cations.					
D) hydrogen io	ns.				
, ,	and hydrogen ions.				
Answer: E	, 0				
15) The reverse of a d	ehydration synthesis	s reaction is a(n)	reaction.		15)
A) anabolic		()			,
B) endothermi	2				
C) exchange					
D) metabolic					
E) hydrolysis					
Answer: E					
16) A hydroxyl	acts as a base.				16)
A) salt	B) group	C) anion	D) atom	E) cation	,
Answer: C	, 0 1	,	,	,	
17) The chemical form	nula of a solid indica	tes it contains two g	roups with different	electronegativities	17)
This substance is:		ices it contains two gr	oups with universit	erectronegativities.	
A) radioactive.					
B) a nonpolar r	nolecule.				
C) a salt.					
D) non-ionic.					
E) a mixture.					
Anguari C					

18) You are performing an experiment in your chemistry lab class. The directions advise caution	18)
because the reaction is exothermic. Which of the following is the hazard the directions warn about? A) The reaction may cause the container to become dangerously hot. B) The reaction will produce a noxious vapor. C) The reaction will generate enough light to require eye protection. D) The reaction may cause the container to freeze and break. E) The reaction will generate radiation.	·, <u> </u>
Answer: A	
19) The reaction described below is consistent with	19)
Serine + ATP Serine-P + AMP	
A) a catabolic reaction.B) an exchange reaction.C) a synthesis reaction.D) a decomposition reaction.E) both synthesis and decomposition.	
Answer: B	
 20) Nucleic acid polymers, proteins, and complex carbohydrates are all produced by A) dehydration synthesis. B) exchange reactions. C) hydrogen bonding. D) hydrolytic reactions. E) catabolic reactions. 	20)
Answer: A	
21) Which of the following is an example of a polysaccharide? A) glycogen B) fructose C) glucose D) sucrose E) deoxyribose	21)
Answer: A	
 22) Research suggests taking antacids may make people more susceptible to infection with <i>Vibrio vulnificus</i> by making the stomach environment more tolerable to the bacteria. Based on this information and the name "antacid," which of the following are antacids likely to be? A) acids B) non-polar compounds C) buffers D) bases 	22)
E) either base or buffer Answer: E	
IMOVOL, E	

23) All of the following are components of an amino acid EXCEPT a(n)	23)
A) carboxyl group.	
B) pentose group.	
C) amino group.	
D) R group.	
E) α -carbon.	
Answer: B	
24) Which of the following is found in nucleic acids?	24)
A) carboxylic acid	
B) purines	
C) glycerol	
D) R group	
E) amino groups	
Answer: B	
25) Hydrogen bonds are found in all of the following EXCEPT	25)
A) in the DNA double helix between nucleotides.	
B) between the R groups of amino acids in proteins.	
C) in the structure of complex polysaccharides.	
D) between water molecules.	
E) between phosphates in ATP.	
Answer: E	
26) Tertiary and quaternary structure of proteins involves bonds.	26)
A) ionic	
B) nonpolar covalent	
C) polar covalent	
D) hydrogen	
E) hydrogen, ionic, polar, and nonpolar covalent	
Answer: E	
	25 \
27) Which of the following are examples of pyrimidines?	27)
A) cytosine and guanine	
B) cytosine and thymine	
C) uracil and adenine	
D) thymine and guanine	
E) thymine and adenine	
Answer: B	
28) A magramalogula containing two fatty acids and a phosphate group is a	201
28) A macromolecule containing two fatty acids and a phosphate group is a	28)
A) glycerol.	
B) wax.	
C) phospholipid.	
D) steroid.	
E) saturated fatty acid.	
Answer: C	

29) The "backbone" of the DNA molecule is composed of	29)
A) pentoses.	
B) phosphates.	
C) amino acids.	
D) alternating phosphates and pentoses.	
E) nitrogenous bases.	
Answer: D	
30) Which of the following would NOT normally be found as a component of a cell's nucleic acids?	30)
A) cytosine ribonucleotides	,
B) adenine deoxyribonucleotides	
C) adenine ribonucleotides	
D) thymine deoxyribonucleotides	
E) uracil deoxyribonucleotides	
·	
Answer: E	
31) All of the following are associated with ATP molecules EXCEPT	31)
A) high-energy bonds.	
B) a recyclable energy supply.	
C) a long-term energy supply.	
D) formation of coenzymes.	
E) three phosphate groups.	
Answer: C	
Allower. C	
32) Which of the following is TRUE of both DNA and RNA?	32)
A) They are highly hydrophobic macromolecules.	
B) They contain adenine, cytosine, guanine and thymine.	
C) The "backbone" is composed of riboses and phosphates.	
D) The purines and pyrimidines form hydrogen-bonded pairs.	
E) They are usually double-stranded helices.	
Answer: D	
Allower. D	
33) Which of the following is an INCORRECT pairing?	33)
A) secondary structure; β-pleated sheets	
B) secondary structure; disulfide bridges	
C) primary structure; amino acid sequence	
D) tertiary structure; covalent bonds	
E) quaternary structure; two or more polypeptides	
Answer: B	
34) Proteins contain both acidic and basic R groups, and can therefore function as	34)
A) catalysts.	
B) structural macromolecules.	
C) energy storage macromolecules.	
D) buffers.	
E) genetic material.	
Answer: D	

35) Which of the following is characteristic of proteins?	35)
A) Their secondary structure is composed of β -helices.	
B) They have multiple layers of structural organization.	
C) They are composed of carbohydrate.	
D) They are primarily hydrophobic.	
E) They are composed of nucleic acids.	
Answer: B	
36) Plant cell walls are composed of held together by	36)
A) polysaccharides; hydrogen bonds	
B) amino acids; peptide bonds	
C) fatty acids; polar covalent bonds	
D) peptidoglycan; ionic bonds	
E) disaccharides; hydrophobic interactions	
Answer: A	
37) A(n) is an arrangement of atoms found in a variety of macromolecules.	37)
A) salt	
B) functional group	
C) buffer	
D) isotope	
E) stereoisomer	
Answer: B	
38) Decomposition reactions are commonly reactions.	38)
A) anabolic	
B) exchange	
C) endothermic	
D) exothermic	
·	
E) dehydration	
Answer: D	
39) Lipids found in the membranes of most eukaryotic cells are	39)
A) phospholipids.	/
B) waxes.	
C) steroids.	
D) triglycerides.	
E) polyunsaturated fats.	
Answer: A	
Miswell 11	
40) Which of the following lipids has the lowest ratio of hydrogens to carbons?	40)
A) monounsaturated fats	
B) polyunsaturated fats	
C) saturated fats	
D) both saturated and monounsaturated fats	
E) Saturated, unsaturated, and polyunsaturated fats have equal ratios of hydrogens to carbons.	
Answer: B	

of a A) micelle. B) polymer. C) salt. D) lipid. E) monome Answer: B 2) Bacterial cell walls are composed of A) peptides. B) waxes. C) peptides and polysaccharides. D) carbohydrates and waxes. E) polysaccharides. Answer: C 3) Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction C) a hydrolysis reaction D) an exchange reaction E) The answer cannot be determined with the available information.	42) _
2) Bacterial cell walls are composed of A) peptides. B) waxes. C) peptides and polysaccharides. D) carbohydrates and waxes. E) polysaccharides. Answer: C 3) Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	^ -
A) peptides. B) waxes. C) peptides and polysaccharides. D) carbohydrates and waxes. E) polysaccharides. Answer: C (3) Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B (4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	^ -
A) peptides. B) waxes. C) peptides and polysaccharides. D) carbohydrates and waxes. E) polysaccharides. Answer: C (3) Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B (4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	^ -
B) waxes. C) peptides and polysaccharides. D) carbohydrates and waxes. E) polysaccharides. Answer: C 3) Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	I, 43) ₋
D) carbohydrates and waxes. E) polysaccharides. Answer: C 33) Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	Н, 43) ₋
E) polysaccharides. Answer: C 3) Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	I, 43) _
Answer: C 3) Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	H, 43) _
Anna is conducting an experiment using a pH indicator that is red at low pH, green at neutral pH and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	I, 43) ₋
and purple at high pH. She starts with a green solution. When she adds compound X to her solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	I, 43) _
solution it turns purple. Then she adds compound Z to the solution and it turns green. She adds more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
more Z and the solution remains green. These observations suggest X is and Z is A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
A) a base; a strong acid B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
B) a base; a buffer C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
C) a buffer; a base D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
D) an acid; a base E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
E) an acid; a buffer Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
Answer: B 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
 4) A reaction requires water as a reactant and produces heat. What type of reaction is likely to be involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction 	
involved? A) a decomposition reaction B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
A) a decomposition reactionB) a synthesis reactionC) a hydrolysis reactionD) an exchange reaction	44)
B) a synthesis reaction C) a hydrolysis reaction D) an exchange reaction	
C) a hydrolysis reaction D) an exchange reaction	
D) an exchange reaction	
E) The answer cannot be determined with the available information.	
Answer: A	
Allower. At	
5) What functional groups are present in ALL amino acids?	45)
A) amino groups	
B) carboxyl groups	
C) hydroxyl groups.	
D) amino and sulfhydryl groups.	
E) amino and carboxyl groups	
Answer: E	
6) Amylose is a(n) carbohydrate.	46)
A) polymer B) ionic C) monomer D) simple E) nucleotic	de
Answer: A	
FALSE. Write 'T' if the statement is true and 'F' if the statement is false.	
(7) The smallest chemical units of matter are elements.	47)
Answer: True • False	′ -

	48) The side groups of amino acids can interact with each other and with other molecules.	48)
	Answer: • True False	
	49) A molecule composed of carbon and hydrogen is a compound.	49)
	Answer: • True False	
	50) The electron shells of atoms hold eight electrons each.	50)
	Answer: True • False	
	51) Carbon atoms have four valence electrons and typically form polar covalent bonds.	51)
	Answer: True • False	
	52) An organic molecule with the chemical formula C4H5O1N3 is probably a pyrimidine.	52)
	Answer: • True False	
	53) Denaturation of a protein is always permanent.	53)
	Answer: True • False	
	54) Glycolipids are an example of a mixture.	54)
	Answer: True • False	
	55) One of the products of dehydration synthesis reactions is water.	55)
	Answer: • True False	
	56) Salts are produced from exchange reactions in which acids and bases neutralize each other.	56)
	Answer: O True False	
SHO	ORT ANSWER. Write the word or phrase that best completes each statement or answers the que	stion.
	57) Radioactive iodine is sometimes used to treat thyroid cancer. This is an example of the use of (isotopes/elements/radiation) in medical treatment.	57)
	Answer: isotopes	
	58) The phosphorylation of a protein by ATP is a(n) (exchange/transfer/group) reaction	58)
	Answer: exchange	
	59) Neon generally does not react with other atoms because it has (2/4/6/8) electrons in its outer shell.	59)
	Answer: 8	
	60) An atom or molecule becomes a(n) (anion/ion/cation) when it loses an electron to a more electronegative molecule.	60)
	Answer: cation	
	61) A chemical reaction in which a water molecule is a reactant is known as a (dehydration/hydrolysis) reaction.	61)
	Answer: hydrolysis	

62) A(n) (base/acid) is a molecule that binds with hydrogen ions when it is dissolve Answer: base	ed in water. 62)
63) The folding of a polypeptide into a three-dimensional shape is its (secondary/tertiary/quaternary) structure. Answer: tertiary	63)
64) The "double helix" of DNA is the result of (covalent/ionic/hydrogen) bonds. Answer: hydrogen	64)
$\begin{array}{cccccccccccccccccccccccccccccccccccc$	65)
Figure 2–2 depicts the (primary/secondary/tertiary) structure of a protein. Answer: primary	
66) A(n) (catalyst/enzyme/protein) is any molecule that speeds up a chemical reacti Answer: catalyst	ion. 66)
67) A fatty acid with two double bonds is a (saturated/monounsaturated/polyunsat	turated) fat. 67)
68) A chemical reaction that traps energy within newly formed chemical bonds is a (exothermic/endothermic) reaction. Answer: endothermic	nn 68)
69) A(n) (indicator/base/buffer) is a substance that maintains the pH even when the of acid and/or base are changing. Answer: buffer	e amounts 69)
70) The functional group of a monosaccharide is a(n) (amino/carboxyl/hydroxyl/car Answer: hydroxyl	rbonyl) 70)
71) The (atoms/isotopes/stereoisomers) of an element vary in the number of neutro nucleus. Answer: isotopes	ns in the 71)

ESSAY. Write your answer in the space provided or on a separate sheet of paper.

72) Compare and contrast synthesis reactions with decomposition reactions.

Answer: Synthesis and decomposition reactions are often the reverse of each other. Synthesis reactions consume energy (are endothermic), whereas decomposition reactions release energy (are exothermic). Synthesis reactions often release water molecules in a process called dehydration synthesis, whereas decomposition reactions often consume water molecules in a process called hydrolysis. Finally, decomposition reactions break large macromolecules into their component monomers, which can then be used in synthesis reactions to build new macromolecules for use by the cell, whereas synthesis reactions utilize component monomers to build larger molecules.

73) Discuss the importance of hydrogen bonds in the chemistry of the cell.

Answer: The chemistry of the cell would basically be impossible without hydrogen bonds. Water, which is required by all cellular reactions, would not have its unique properties of cohesiveness and polarity without hydrogen bonds. Hydrogen bonds hold the double helix of DNA together and contribute to the overall shape of protein molecules. However, unlike covalent bonds, hydrogen bonds are not permanent bonds, so they can easily and temporarily be broken, a characteristic that is important at certain points in the cell's life cycle (such as during DNA replication).

74) Max is exploring the properties of various compounds. Some of his explorations involve the use of a pH indicator that is red at low pH, yellow–green at neutral pH, and blue to purple at high pH. He sets up several tubes containing water and the pH indicator and then begins to add some of the compounds he is characterizing in various combinations. His results are shown on the Figure 2.3.

									1 × L +
							$1 \times L +$	$1 \times L +$	1 × M
Compound	None	1 × L	1 × M	2 × M	5 × M	1 × N	1 × M	5 × M	+ 1 × N
Color	Green	Red	Green	Blue	Purple	Green	Red	Green	Green

What can Max conclude about his compounds based on these results? Describe the likely events in terms of hydrogen and hydroxyl ions.

Answer: Max's results are consistent with L being an acid and M being a weak base. Compound N appears to be a buffer. The green color of the indicator is seen when the concentrations of hydroxyl and hydrogen ions are equal. The red color of the solution indicates the concentration of hydrogen ions is greater than the hydroxyl ion concentration. The data does not provide information for calculating the concentrations. Blue and purple indicator colors show the hydroxyl ion concentrations exceed the hydrogen ion concentrations. The results with the mixes of L and M suggest that L dissolves to release 5 times more hydrogen ions than the concentration of hydroxyl ions produced by the ionization of M. Compound N accepts or releases ions with changing hydrogen ion concentrations to maintain equal concentrations of cations and anions.

75) A student is given a compound to identify in an organic chemistry class. The first thing she notices is that it is not soluble in pure water or saline. Analysis of the ratios of atoms indicates the ratio of carbon to hydrogen to oxygen is 1:1.5:0.05. There is no nitrogen. Based on this information, what class of biological macromolecule is the student working with? Justify your answer.

Answer: The macromolecule is a sterol. The lack of nitrogen eliminates amino acids and nucleic acids. The ratio eliminates carbohydrates, which have a C:H:O ration of 1:2:1. Thus the compound is a lipid. Fatty acids and waxes have a C:H ratio of about 1:2 with only one (wax) or two (fatty acid) oxygens per molecule (C:O ranging from 12:1 to 24:1). The low ratio of H to C suggests many carbons are bonded to three other carbons, consistent with steroids. The presence of some oxygen indicates there are hydroxyl groups, found in sterols.

76) Nitrogen is an essential element for living things, as demonstrated by the fact that nearly all fertilizers contain nitrogenous compounds. Discuss why nitrogen is essential.

Answer: Nitrogen is a component in the structure of two of the four types of organic macromolecules. The amino group of an amino acid is a key reactant in the formation of peptide bonds, or primary structure, of proteins. Nitrogen also participates in hydrogen bonding and thereby contributes to the secondary, tertiary, and quaternary structure of proteins. Nitrogen is a key structural component of the bases in nucleic acids, and its participation in hydrogen bonding results in the formation of the base pairs and therefore the double helix of DNA.
