26. *Addition property of equality:* Start with a possible solution, for example, $x = -4$. Now add an abitrary number, say -5, to both sides, to give us the equation $x - 5 = -9$.

Division property of equality: Start with a possible solution, for example, $-4 = y$. Now multiply both sides by an abitrary number, say 6, to give us the equation $-24 = 6y$.

Thus, equations will vary. Two possibilities are

$$x - 5 = -9 \quad \text{and} \quad -24 = 6y.$$

Solving:

$$\begin{aligned} x-5 &= -9 \\ 5 \quad & \quad 5 \quad \textit{Add 5 to both sides.} \\ \hline x &= -4 \\ -24 &= 6y \\ \frac{-24}{6} &= \frac{6y}{6} \quad \textit{Divide both sides by 6.} \\ -4 &= y \end{aligned}$$

Average distance "per" day implies division.

Estimate: $\dfrac{600 \text{ miles}}{20 \text{ days}} = 30$ miles per day

\$8 stays \$8 (it's a single digit number).

Each stock dropped in value by \$8 and Doug owned 52 shares. Multiply to find out how much money he lost. Then, subtract this amount from the original total value.

Estimate: $\$2000 - (50 \cdot 8) = \$1600$
Exact: $\$2132 - (52 \cdot 8) = \$1716$

His shares are now worth \$1716.

23. \$758 rounds to \$800.
\$45 rounds to \$50.
12 months (in one year) rounds to 10.

Estimate: $10(\$800 + \$50)$
