Project Management: Achieving Competitive Advantage, 5e **(Pinto)**
Chapter 1 Introduction: Why Project Management?

1) Low inflation is a trigger for improved project management skills because:
A) Rampant cost increases must be passed along to the consumer.
B) Internal process improvement is accomplished via project management.
C) Lower inflation means narrower product launch windows.
D) Global markets are a prerequisite for low inflation.
Answer: B
Diff: 1
Section: 1.3 Why Are Projects Important?
LO: 1.3: Understand why effective project management is such a challenge.
Classification: Concept
AACSB: Application of Knowledge

2) Projects, rather than repetitive tasks, are now the basis for most value-added in business.
Answer: TRUE
Diff: 1
Section: 1.1 The Importance of Projects
LO: 1.1: Understand why project management is becoming such a powerful and popular
practice in business.
Classification: Application
AACSB: Application of Knowledge

3) The emergence of global markets has made project management skills more critical.
Answer: TRUE
Diff: 1
Section: 1.3 Why Are Projects Important?
LO: 1.3: Understand why effective project management is such a challenge.
Classification: Application
AACSB: Application of Knowledge

4) What roles do traditional process management duties of planning, organizing, and controlling
play in project management, if any?
Answer: The traditional managerial duties of planning, organizing, and controlling all apply to
project management. Project managers must be technically well versed, proficient at
administrative functions, willing and able to assume leadership roles, and above-all, goal
oriented. The project manager is the person most responsible for keeping track of the big picture
Diff: 2
Section: 1.2 What Is a Project?
LO: 1.2: Recognize the basic properties of projects, including their definition.
Classification: Application
AACSB: Application of Knowledge

5) Why is project management challenging?
Answer: Projects present challenges for a number of reasons; by their nature they are often dramatic departures from the routine process-oriented work that employees are accustomed to. Projects face budget, time, and resource constraints and these resources must often be marshaled from across the organization.

Section: 1.2 What Is a Project?
LO: 1.1: Understand why project management is becoming such a powerful and popular practice in business.
Classification: Application
AACSB: Application of Knowledge

6) Why are projects important?
Answer: Today's businesses face a set of pressures that make projects crucial in helping an organization achieve its strategic goals. These pressures include shortened product life cycles, narrow product launch windows, increasingly complex and technical products, the emergence of global markets, and an economic period marked by low inflation.
Diff: 1
Section: 1.3 Why Are Projects Important?
LO: 1.3: Understand why effective project management is such a challenge.
Classification: Concept
AACSB: Application of Knowledge

7) Why is project management considered an excellent training ground for future senior executives in many organizations?
Answer: One of the unique aspects of projects is their unique blend of technical and behavioral challenges. The technical side of project management requires managers to become skilled in project selection, budgeting and resource management, planning and scheduling, and tracking their projects. The behavioral side of project management requires project managers to bring together individuals from across the organization, mold them into a team, manage conflict, provide leadership, and engage in negotiation and appropriate political behavior.

AACSB: Application of Knowledge

35) The special nature of projects relieves project managers from their routine of planning, organizing, motivating, directing, and controlling.
Answer: FALSE
Diff: 2
Section: 1.2 What Is a Project?
LO: 1.2: Recognize the basic properties of projects, including their definition.
Classification: Application
AACSB: Application of Knowledge

36) What are key differences between projects and processes?
Answer: A process refers to ongoing, day-to-day activities in which an organization engages while producing goods and services. Processes use existing systems, properties, and capabilities in a continuous, fairly repetitive manner. Projects take place outside the normal, process-oriented world of the firm and project management activities remain unique and separate from the manner in which process-oriented work is performed. Differences are listed in the table reproduced below.

Process	Project
Repeat process of product	New process or product
Several objectives	One objective
Ongoing	One shot—limited life
People are homogeneous	More heterogeneous
Well established systems in place to integrate efforts	Systems must be created to integrate efforts
Greater certainty of performance, cost, schedule	Greater uncertainty of performance, cost, schedule
Part of line organization	Outside of line organization
Bastions of established practice	Violates established practice

63) Describe the activities that occur at each stage of a project.
Answer: Stages in a project's development are referred to as the project life cycle, which consists of conceptualization, planning, execution, and termination. In the conceptualization stage the scope of the work is determined, necessary resources are identified, and important organizational stakeholders signed on. In the planning stage all detailed specifications, schematics, schedules, and other plans are developed. Individual pieces of the project are broken down, individual assignments are made, and the process for completion is delineated. During the execution phase the system is developed or the product is created and fabricated. Termination occurs when the completed project is transferred to the customer, the project's resources are reassigned, and the project is formally closed out.

64) Use the project life cycle and intensity level graph to describe your journey in your current degree program. Provide the number of credit hours you have earned and the number remaining in your program and briefly describe key events that show peaks or valleys in the five components.
Answer: Examples will vary, but the student should construct the intensity level versus time plot and show uncertainty, creativity, resources, project stake, and client interest waxing and waning as he moves through the PLC.
Diff: 1
Section: 1.4 Project Life Cycles
LO: 1.4: Understand and explain the project life cycle, its stages, and the activities that typically occur at each stage in the project.
Classification: Concept
AACSB: Application of Knowledge

65) Where in the project life cycle are the intensity level of resources and client interest at their highest? Why is this the case?
Answer: The intensity level of resources peaks during the execution phase of the project life cycle. The actual work is performed during this phase, so the commitment of financial, human, and technical resources peaks at this time. The level of enthusiasm or concern expressed by the project's intended customer peaks in both the conceptualization and termination phases. The client is initially very interested because they provide input on the goal and specifications of the project. Project work moves out of the conceptual phase to a more internal mode and the client's interest wanes until the project nears delivery. At this point the client's interest peaks again as they prepare to receive the completed project and all the associated benefits.

83) Rank the determinants of project success from most important to least important and justify your rankings.
Answer: Answers with regard to ranking may vary since, for example, circumstances may dictate that time is an overriding concern at the expense of quality and cost. The determinants of project success are: conformance to budget, schedule, performance specifications, and client acceptance.
Time—Projects are constrained by a specified timeframe during which they must be completed; they are not supposed to continue indefinitely.
Cost—Projects must meet budgeted allowances in order to use resources as efficiently as possible.
Performance—Projects are developed in order to adhere to some initially determined technical specifications. Performance measurement means determining whether the finished product operates according to specifications.
Client acceptance—Projects are developed with customers in mind; their purpose is to satisfy customers' needs. If the completed project meets all internal criteria but does not satisfy the customer, then the project has not been a complete success.

86) One model of project success offered in the chapter looks beyond the current project into the future. Comment on the elements of this model and their impact along the timeline from project completion to well beyond this point in time.
Answer: This framework was proposed by Shenhar, Levy, and Dvir and contains in chronological order, the elements of project efficiency, impact on the customer, business success, and preparing for the future. The immediate measure of success is efficiency, that is, have the project budget and schedule been achieved? More important, have the customer needs, technical specifications been met? Next, has the project achieved the commercial success that was hoped for? Finally, has the project opened new markets or new product lines, helped develop new technologies, or developed new skills for the organization?

99) Describe the project management characteristics of firms that reside at the lowest levels of the ESI, SEI, Center for Business Practice, and Kerzner maturity models and characteristics of firms that reside at the highest levels of these models.
Answer: The lowest level of each model is occupied by companies that have no clear sense of project management. There is no common project management language within these companies and management processes, if any exist, are ad hoc. Firms occupying the highest level of project management maturity are project savvy; having progressed beyond simply applying project management to processes. These firms actively explore ways to continuously improve project management techniques and procedures.

100) What are the three levels of the generic project management maturity model and what are the characteristics of a company at each level? Provide examples of organizations at each of these levels and support your choices.
Answer: The lowest maturity level of the generic model is reserved for companies that have an ad hoc approach to project management. There is no common language for project management and little support for project workers and the projects. At the moderate maturity level, the organization has defined practices, some training programs for project management and organizational support dedicated to these efforts. At the high maturity level, the process of project management is institutionalized and there are continuous improvement efforts underway from one project to the next. Example organizations will vary.
